ADVOLEVEL

CONSOLIDATED CONTRACTOR SCOPE | UX/UI + FULL-STACK COMMERCIAL V1

One accountable contractor or agency • One fixed-price agreement • Milestone-based acceptance

1. Product outcome

Deliver a secure, production-deployed, multi-tenant AI executive operating system. Each organization has its own workspace, organizational knowledge, configurable AI executives, collaborative boardrooms, governed actions and subscriptions. This is a functioning commercial SaaS, not a prototype. All workstreams below are included in one proposal.

2. UX/UI design and frontend

- Create editable Figma design system and clickable critical-flow prototype following Concept B: deep navy, warm neutrals, restrained gold, premium editorial/executive aesthetic.
- Design and implement the approximately 57 core screens in the existing screen inventory across public website, onboarding, command center, executive offices, boardrooms, knowledge, cases/work, approvals, Content Factory, billing and administration. Reconcile the exact inventory before contract signature.
- Use shared components and responsive layouts for desktop, tablet and mobile; cover meaningful loading, empty, error, permission and approval states. Deliver editable Figma source, assets and responsive working frontend.

3. Platform and executive intelligence

- Tenant-isolated authentication, organization/team membership, invitations, backend-enforced roles and permissions, customer admin and platform admin.
- One reusable Executive Brain/orchestrator with five functioning configurable specialist executives; administrators can configure additional roles, instructions, tools and permissions without rebuilding the app.
- Persistent executive offices and multi-executive boardrooms with case context, decisions, task follow-through and searchable history.
- Organizational DNA (mission, goals, policies, SOPs, brand and structure); document upload, parsing, tenant-isolated RAG/source retrieval, contextual case memory and retention/deletion controls.
- Native cases, projects and tasks: create, assign, track, update, close and link work to decisions and approvals.

4. Governance, integrations and Content Factory

- Central allow/deny/require-approval policy checks; human approval queue; complete audit trail. Approved internal and external actions must actually execute with authorization, safe retries and failure reporting.
- Working API-based integrations with ClickUp (task/work synchronization), GoHighLevel (CRM/contact/workflow operations), Dropbox and Google Drive (authorized document access/import), Stripe (monthly/annual billing, plan entitlements and customer management),

and AI model APIs. Exact read/write operations and any publishing destinations must be listed in the signed inclusion matrix.
- Content Factory: media/document intake, transcription when applicable, AI drafting/transformation, review/approval, status tracking and at least one agreed functional publish/export destination. Use existing APIs/services rather than building a custom media editor.

5. Cost-efficient engineering principles

Use proven frameworks, a modular application, reusable UI components, a single configurable executive engine, shared governance/workflow services, established LLM APIs, managed infrastructure and documented third-party APIs. Suggested stack: Next.js/React, Python/FastAPI or equivalent, PostgreSQL/pgvector, Stripe and managed storage/auth. Contractor may propose alternatives that meet the same outcomes. No proprietary model training, custom billing engine or full video editor is required.

6. Quality, deployment and ownership

- Automated and manual testing of critical flows, tenant isolation, access control, approval bypass prevention, billing, AI orchestration, document retrieval, integrations and failed-action handling.
- Deploy into AdvoLevel-controlled infrastructure and accounts; provide source repository, editable Figma files, configurations/prompts, deployment instructions, credentials inventory, monitoring/backup basics and technical documentation.
- All commissioned source, designs and custom artifacts belong to AdvoLevel upon payment, subject to disclosed third-party licenses. Include defined defect correction/warranty terms.

7. Proposal and acceptance requirements

- Quote ONE all-inclusive fixed total covering UX/UI, frontend, backend, AI, integrations, QA, deployment and handoff. Do not replace the requested commercial V1 with a reduced phase or paid hourly discovery.
- Return an INCLUDED / EXCLUDED / NEEDS CLARIFICATION matrix for Sections 2–6, with the reconciled 57-screen list and exact integration actions/publishing destination(s).
- Provide milestone amounts and objective acceptance tests. Demonstrate functioning software and transfer deliverables at each acceptance gate; visual mockups or simulated AI actions do not constitute completion.
- Disclose third-party recurring service charges separately, staffing and design ownership, dependencies, warranties and any exclusions before contract signature. Scope changes require written approval.

Contracting note: This is a concise quotation baseline. The detailed master SOW, workflows and design inventory remain supporting specifications; any conflicts or omissions must be reconciled in writing before award.
